

The variable were the ~~and~~ enzymes to control
the cups of the Apple sauce.

This response does not identify any variables that need to be controlled. There is no discussion of why it is important to control variables in an experiment. It is an unsatisfactory response to the question.

This response shows an accurate bar graph of the results. The x-axis shows discontinuous data (cups A-D). The axes are properly labeled (including units) and scaled. Data points are plotted accurately.
